

Equally Likely

Equally likely means that two things have the same chance of happening like it's equally likely that if you flip a coin you can get heads or tails. It's a 50-50 chance. Or it's equally likely that dinosaurs live on the moon as it is that humans live on Pluto.

Equally Likely

Equally likely means that 2 or more things have the same amount of chance to happen. For example, it is just as likely that Godzilla will jump out of someone's TV and invade the earth as there are aliens with snowshoes for feet playing ice hockey on the rings of Saturn.

Probability, TV

Probability is mostly guessing. It is equal chance. Like when they say on the news it will be a 50 percent chance of rain. That means it will probably or probably not rain. The higher percentage is more likely to rain. If was a lower percentage it would be unlikely to rain. That is how they tell the weather. No one really knows what the weather is going to be, sometimes the news reporters are really wrong!

The importance of probability in your life is to know what to wear in certain days, or when you go camping in the summer you are not going to bring pants and sweat shirts, you are going to bring tank tops and shorts.

Probability is like you do some of

chance and you win or lose.

I think the chance of winning could be 20% or another thing could be 50%.

Today I learned about "Probability". This is an example of Probability. It is 60% ~~sure~~ that it's going to rain. 0% is the lowest and 100% is the highest. If there is 50% chance of raining and 50% chance that it's not going to rain, no one will know. I think Probability is important because if your TV brakes you could look at the whether and think if it's unlikely or likely going to rain.
